This project was undertaken by Stone Environmental, Inc. for the Village of Essex Junction and the Town of Essex, with funding provided by the Vermont Agency of Transportation, STP MM18(2).

The intent of this plan is to present data collected, evaluations, analysis, and cost estimates for the Essex Junction and Essex Town Phosphorus Control Plans, completed under a contract between the Village of Essex Junction and the consultant team, including Stone Environmental, Inc., Horsley Witten Group, and Stantec. The Essex Junction and Essex Town PCPs were prepared to meet compliance requirements for the *VPDES General Permit 3-9014 (2018) for Stormwater Discharges from Regulated Small Municipal Separate Storm Sewer Systems (MS4s) and Certain Developed Lands* for the Village of Essex Junction and the Town of Essex. The presented plan is in draft form and will be revised by the MS4 partners as needed. Further, it will remain a working document, subject to change as projects are further investigated. Neither of the MS4s are bound in any way to the proposed BMP lists included in this plan document. This PCP and its implementation are contingent upon the MS4s' ability to gain permits and to gain municipal funding approval.

Phosphorus Control Plans for the Essex Junction and Essex Town MS4s

Cover Photo: This swale, at the intersection of South Street and Wilkinson Drive in Essex Junction, is one promising site where an infiltrating stormwater retrofit may be constructed to help meet MS4 phosphorus reduction requirements.

1. Introduction

As required by the Vermont Municipal Separate Storm Sewer System General Permit (MS4 Permit)¹, the Village of Essex Junction and Town of Essex are required to develop Phosphorus Control Plans (PCPs) "designed to achieve a level of phosphorus (P) reduction equivalent to the percent reduction target for developed land in the associated TMDL lake segment(s) as applied to municipally owned developed lands".

Developed lands that are not under the Village's or Town's ownership or control are not the MS4s' responsibility under this PCP. Developed lands owned and controlled by the Vermont Agency of Transportation (VTRANS), for instance, are regulated under the Vermont DEC *General Permit 3-9007 for Stormwater Discharges from the State Transportation Separate Storm Sewer System (TS4)* and its attendant PCP requirements. VTrans roadways and rights-of-way were not included in Essex Town's MS4 impervious or pervious surface areas to be managed under the PCP. Portions of VT Route 15 and VT Route 2A were similarly excluded for Essex Junction (Section 2). The MS4s may, however, coordinate with VTrans regarding implementation of individual retrofits or other projects where it is mutually beneficial for them to do so.

Similarly, school properties in Essex Junction and Essex Town are all part of the Essex Westford School District, and many of the school facilities have operational stormwater permits from Vermont DEC. These properties are owned and controlled by the school district, so although they are quasi-municipal in nature these properties are not included in the MS4s' PCP areas or phosphorus target reductions. Most of the Essex Westford school campuses located in Essex Junction and Essex Town are subject to the "3-acre site" requirements of Vermont DEC General Permit 3-9050², and are therefore required to obtain permit coverage and retrofit subject sites to improve the level of stormwater treatment. While schools are not part of the Village or Town MS4 areas, school properties may have open space that represents opportunity for collaboration on retrofits that benefit both the School District and the MS4(s), and this PCP retains flexibility for schools and MS4s to work together in the future.

The Phosphorus Control Plan first documents the areas and resulting phosphorus base load subject to the conditions of the PCPs. It then describes progress towards target P reductions achieved by the Essex Junction and Essex Town MS4s through implementation of structural stormwater treatment practices (STPs) owned, controlled, or maintained by the MS4s via inspection/maintenance agreements, through improvements to hydrologically connected road segments and culvert outlets, and through performance of non-structural practices such as street sweeping and catch basin cleaning within their PCP areas from 2010-2020.

The PCP then documents a menu of structural STPs, municipal road segment and culvert outlet repairs, enhanced non-structural controls (particularly street sweeping), and implementation of enhanced ordinances or regulations to address sub-jurisdictional impervious surfaces that the Essex Junction and Essex Town MS4s may use to achieve required P reductions from municipally-owned developed lands.

¹ https://dec.vermont.gov/sites/dec/files/wsm/stormwater/docs/MS4/VT%20MS4%20GP%202018.pdf

² <u>https://dec.vermont.gov/watershed/stormwater/9050/3-acre-properties</u>

While the plan is conservative and demonstrates both the Village and Town have identified sufficient improvements to meet and exceed their target phosphorus reductions, elements related to hydrologically connected road segments meeting standards will necessarily change based on re-inventory, road and outlet maintenance practices, and on the frequency and intensity of future storm events. Thus, the presented plan is in draft form and will be revised by the MS4 partners as needed. This PCP is contingent on Board approval or adoption for both Essex Junction and Essex Town. It will remain a working document, subject to change as projects are further investigated. Implementation of the PCP is also contingent upon the MS4s' ability to gain permits and to gain municipal funding approval.

2. Phosphorus Control Plan Areas, Base Loads, and Reductions Required

Using GIS datasets and spreadsheet summaries, Stone estimated the developed lands P base load and target load reductions for the Village and Town's rights-of-way (ROW), municipally owned parcels, and other municipally owned or controlled lands that collectively constitute the PCP area³ (Map 1). Roadways, rights-of-way, and facilities owned and controlled by VTrans but located within the Village or Town were excluded. The Village of Essex Junction is required to meet an annual P load reduction target of 31.7 kg/yr, while the Town of Essex must reach a P reduction target of 74.6 kg/yr - a 20% reduction from base conditions for both municipalities (Table 1).

Lake Segment	Drainage Area	Acres (All Developed Land Use Classes)	P Base Load (kg/yr)	Total Developed Lands P Target Reduction	Total P Reduction Target (kg/yr)							
Village of Essex Junction Summary												
Main Lake	Winooski River	208.8	111.9	20.2%	22.6							
Malletts Bay	Malletts Bay - DD	133.8	44.5	20.5%	9.1							
Total		342.5	156.4		31.7							
		Town of Es	sex Summary									
Main Lake	Winooski River	378.7	215.8	20.2%	43.6							
Malletts Bay	Lamoille River	85.2	83.9	20.5%	17.2							
Malletts Bay	Malletts Bay - DD	145.2	67.3	20.5%	13.8							
Total		609.2	367.0		74.6							

Table 1. Phosphorus base	e loads and reduction	n targets by	lake seament ³

Note: The P base loads and target P reductions were developed using the developed lands GIS dataset and loading rate tables provided by VT DEC in January 2019. VT DEC updated the loading rate tables in fall 2019 to include classifications for developed pervious land use by hydrologic soil group. The P base loads were re-calculated based on the updated loading rate table, but this update did not significantly change the P base loads for Essex Village/Town.

³ Stone Environmental (2020) "Essex Phosphorus Control Plans – Revised Drafts of Area, Base Load, and Target Reductions" Submitted to Essex Town & Village and ANR January 15, 2020.

3. Structural Stormwater Treatment Practices

Structural STPs that may be credited towards P reduction for the PCP per Section 8.2.A.3 of the MS4 Permit¹ include:

- Retrofits to municipally owned properties;
- Implementation of STP upgrades or retrofits to treat existing impervious after the adoption of the 2002 VSMM;
- Implementation of STPs after July 1, 2010 on developed lands not subject to the state's operational stormwater permit;
- Management of stormwater and STPs including non-municipally-owned lands subject to an operational stormwater permit that does not otherwise require an upgrade of the stormwater system to comply with Vermont Department of Environmental Conservation (DEC) stormwater regulations, provided that the MS4 assumes responsibility for the stormwater system and/or establishes a maintenance agreement with the property owner(s) to ensure maintenance.

Phosphorus reductions were calculated for constructed and design-phase STPs under Essex Village/Town ownership or management jurisdiction, and which are eligible for P reduction credit, using the Agency of Natural Resources' (ANR) Best Management Practice (BMP) Tracking Table⁴.

The annual P load reductions achieved or expected from completed and design-phase structural STPs summarized in Figure 1 range from over 150% of the PCP Area's target load allocation (12.7 kg/yr) in Essex Junction's Malletts Bay Lake segment, to roughly a third of the target P load reductions in the Village's Main Lake segments. In the Main Lake segment for both the Town and Village, identification of additional projected structural STPs was completed to meet target P reductions. If and as the Town prefers to implement structural STPs outside of its Sunderland Brook stormwater-impaired watershed area in order to meet its MS4 phosphorus reduction obligations, the structural STPs projected in the Alder Brook watershed and in Winooski River direct drainages may be advanced in coordination with MRGP outlet rehabilitation, stormline replacements, or other strategic retrofit efforts. Details of the structural STPs are presented below.

⁴ https://dec.vermont.gov/sites/dec/files/wsm/stormwater/docs/MS4/BMPTrackingTable_03132020.xlsx

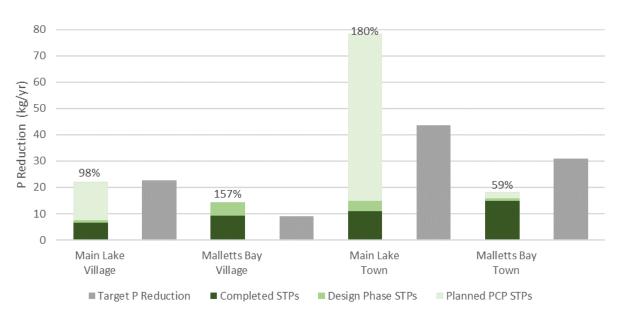

Figure 1. Summary of annual P load reductions from existing, design-phase, and projected structural STPs as compared to required target P reductions (kg/yr). See Tables 2 and 6 for completed STPS; Tables 3 and 7 for design-phase STPs, and Tables 5 and 8 for projected STPs.

3.1. Essex Junction Completed and Design-Phase Structural STPs

A total of eight creditable structural STPs have been completed as of December 2020 (Table 2, Appendix B-1, and Map 2) in the Village, which collectively manage stormwater from a combined 32 acres of impervious area and 58 acres of pervious area. As seen in Table 2 and Figure 1, in the Malletts Bay Lake segment, combined P load reductions from completed projects exceed the P target reduction (9.3 kg/yr or 102% of the total required P reduction). Completed STPs account for 30% of the Village's required P reduction in the Main Lake segment (6.7 kg/yr).

	-	Lake		Impervious	Pervious	Storage volume	P Credit	% of P
Site Name	Permit No.	Segment	BMP Type	(acres)	(acres)	(ft³)	(kg/yr)	Target

Table 2. Essex Junction Completed Structural STPs

Four additional creditable structural STPs are in design phases (Table 3, Appendix B-2, and Map 2) in the Village, which collectively may manage stormwater from a combined 13 acres of impervious area and 19 acres of pervious surface. Since the Village's required P load reduction for the Malletts Bay Lake segment is met primarily through STPs constructed for compliance with the Indian Brook Flow Restoration Plan, the additional practices listed in Table 3 are not further advanced in this PCP. Design-phase STPs are anticipated to account for an additional 4% of the Village's required P reduction in the Main Lake segment (0.9 kg/yr).

Site Name	Permit No.	Lake Segment	BMP Type	Impervious (acres)	Pervious (acres)	Storage volume (ft ³)	Practice Efficiency (%)	P Credit (kg/yr)	% of P Target
Acorn Circle cul- de-sac retrofit - media filter with specialized media		Main Lake	Sand filter (w/ underdrain)	1.10	0.70	3,700	48.2%	0.87	3.85%

	Total	Malletts Bay		10.66	17.98	6,839		3.41	37%

Table 3. Essex Junction Design-Phase Structural STPs

3.2. Essex Junction Projected Structural STPs

Additional structural STP opportunities were screened at the desktop level in the portions of the Village draining directly to the Winooski River, primarily south and southwest of the Five Corners area in residential subdivisions underlain by deep, well-drained and relatively flat Adams and Windsor series loamy sands. The subdivisions hosting these closed drainage systems are well suited to an "invisible green stormwater infrastructure" approach, where retrofits to replace existing catchbasins with drywells, or to add subsurface infiltration chambers as offline treatment for existing catchbasins, would improve water quality while reducing residents' concern about maintenance of vegetated surface green infrastructure practices.

Projected retrofit opportunities were screened first by reviewing the stormwater infrastructure inventory and LiDAR topography with land cover and soil data to identify drainage areas contributing flow to individual catch basins or drainage system outlets as appropriate. The retrofits were further screened for environmental constraints including but not limited to wetlands or wetland buffers; hydric soils; streams, floodplains and river corridors; and rare, threatened, or endangered species. Where possible, retrofit opportunities were sited to minimize conflicts with overhead and underground utilities (including cable/telecom, electric, gas, water, and sewer). Confirmation of the presence of utilities will be required as retrofits conceptually identified in this PCP move forward into design phases.

Almost 40 conceptual structural STP retrofits were identified in the Village's Winooski River direct drainages (Map 2, Appendix B-4, and Appendix B-5). Of these, a substantial opportunity was found at the intersection of South Street and Wilkinson Drive for retrofit of a grass channel with an outlet structure into an infiltration basin or trench with enhanced storage, managing 7.9 acres of impervious for a potential P load reduction of

8.9 kg/yr (EJ-WR-038, Table 5 and Map 2). Of the remaining opportunities, two cul-de-sacs (Loubier Drive and Killoran Drive) contain opportunities to both reduce impervious cover and install subsurface drywells or infiltration practices. Immediately to the south, a similar approach could be applied at the neighborhood scale along Cascadnac, Owaissa, and Wenonah Avenues (Table 5, Map 2). Collectively, these green stormwater infrastructure retrofits would manage at least 13 impervious acres and result in a P load reduction of 14.8 kg P/yr. Projected structural STP retrofits considered, but which were not further advanced, are listed in Appendix B-5.

3.2.1. Structural STP Implementation Cost Estimation

For newly proposed structural STPs in both Essex Junction and Essex Town, implementation costs were estimated using construction costs from recent implementation projects, recent projects completed by consulting team members, unit costs per cubic foot of storage from stormwater retrofits recently completed by the Vermont Agency of Transportation, the EPA's Opti-Tool unit cost estimates, and adjustments to the Opti-Tool⁵ unit cost estimates completed for a selection of projects in Vermont and Massachusetts (Table 4). The unit-based implementation costs did not include design and permitting, so a 25% adjustment factor was applied. A factor of 1.25 was additionally applied to the projected unit-based costs to account for the cost differential observed by both MS4s during the implementation of FRP projects.

ВМР Туре	Unit cost (\$/cf)

Table 5. Essex Junction Summary of Projected Structural STPs, Main Lake Segment

3.3. Essex Town Existing and Design-Phase Structural STPs

A total of 10 creditable structural STPs have been completed as of December 2020 (Table 6 and Appendix B-1) in the Town, managing stormwater from a combined 47 acres of impervious area and 81 acres of pervious area. In the Malletts Bay Lake segment, combined P load reductions from completed projects account for 15.0 kg/yr or 48% of the total required P reduction. Completed STPs, primarily constructed to advance completion of the Indian Brook Flow Restoration Plan, account for 25% of the Town's required P reduction in the Main Lake segment (11.0 kg/yr). The list of existing and creditable practices includes infiltration practices on Thompson Drive, where the Town recently received a request to take over operational permit 4181-9015.3 from the permittee. The Town owns the roadway subject to this permit and, pending inspection in the spring of 2021, anticipates incorporating the permit into the Essex Town MS4.

Table 6. Essex Town Completed Structural STPs

Six additional creditable structural STPs are in design phases (Table 7 and Appendix B-2) in the Town. In the Malletts Bay Lake segment, a pair of STPs associated with the Indian Brook Flow Restoration Plan account for management of 0.9 kg/yr (3%) of the Town's required P reduction. For the Main Lake segment, the Town will gain at least 3.8 kg/yr (0.9% of target) in P reduction from retrofits to two cul-de-sacs that are anticipated to move to construction in 2021-2022.

Site Name	Permit No.	Lake Segment	BMP Type	Impervious (acres)	Pervious (acres)	Storage volume (ft³)	Practice Efficiency (%)	P Credit (kg/yr)	% of P Target
Oakwood Drive cul- de-sac retrofit - media filter with specialized media		Main Lake	Sand filter (w/ underdrain)	2.13	3.68	11,500	54.5%	2.71	1%
Oakwood Drive cul- de-sac retrofit - impervious removal		Main Lake	Impervious removal	2.03				0.14	0.05%

Table 7. Essex Town Design-Phase Structural STPs

3.4. Essex Town Projected Structural STPs

In the Essex Town MS4, two substantial STPs are located in the Sunderland Brook watershed and included in that FRP (Outfall 126 and David Drive Outfall) but are not required under that plan (Table 8 and Appendix B-4). While the Outfall 199 retrofit, also identified in that FRP, would move forward only if absolutely necessary, the Outfall 126 and David Drive retrofits represent strong projects that the Town may consider implementing. Coupled with completed and anticipated improvements to hydrologically connected road segments and culvert outlets (Section 4.2), these two structural STP retrofits alone would likely be sufficient to meet target P reductions (Section 7).

In the event that the Town chooses not to prioritize additional structural STPs in the Sunderland Brook watershed, and in order to provide flexibility to the Town in meeting MS4 target P reductions, additional BMP identification was conducted as described below.

The Essex Town MS4 has incorporated over 40 operational permits into its MS4 permit. Most of the STPs included in these permits were constructed before the 2010 base monitoring period for the Lake Champlain P TMDL and thus are not presently eligible for P reduction credit – and many are located in the Malletts Bay Lake segment. However, for those in the Alder Brook and direct Winooski watersheds, they represent

opportunities for strategic retrofit to achieve compliance with the MS4's P reduction obligations under the Essex Town PCP. While many of the incorporated permits include only closed drainage systems to outlets or grass channels, three sites were selected for further review in consultation with the Town (Appendix B-3 and Appendix B-4):

- Convert existing wet pond at Autumn Knoll (4367-9010.R) into a gravel wetland and maintain existing pond's extended detention.
 - The retrofit is located in the Mallets Bay Lake segment (draining to the Browns River and ultimately the Lamoille River). The concept appears feasible and represents a P reduction of approximately 2.4 kg/yr. This opportunity was included in the projected list of structural STPs (EX-LR-001, Table 8).
- Convert existing grass swales in the Old Stage Village Development (3579-9010.R) into dry swales.
 - While maintenance of the existing swales is needed, the soils appear to have limited suitability for infiltration compared to other areas in Town, and open space for construction of STPs outside of the existing grass channels is limited (Appendix B-5).
- Convert existing wet pond at Meadows Edge (3324-9010.R) into a gravel wetland.
 - This concept appears feasible and represents a substantial P reduction (approximately 9 kg/yr). This retrofit opportunity was included in the projected list of structural STPs (EX-WR-001, Table 8).
- Convert existing dry extended detention pond at Craftsbury Court (3581-9010.R) to a gravel wetland, maintaining the existing basin's storage volume.
 - This concept appears feasible and represents a reasonable P reduction (approximately2.8 kg/yr). The retrofit opportunity was included in the projected list of structural STPs (EX-WR-040, Table 8).

Additional structural STP opportunities were screened in the Main Lake segment at the desktop level, focusing on areas where closed drainage system outlets were identified as Not Meeting Standards through the 2017 REI (Section 4.2). In many cases, the subdivisions hosting these closed drainage systems were constructed on highly infiltrative and highly erodible soils, such that focused retrofits to replace existing catchbasins with drywells, or to add subsurface infiltration chambers as offline infiltration practices for existing catchbasins, would both improve water quality and reduce downstream flow and velocity at the drainage system outlets. Eleven such opportunities were identified in the Alder Brook watershed and in Winooski River direct drainages along Foster Road, Saxonhollow Road and Hillside Avenue, Sand Hill Road, Greenbriar Drive and Greenfield Road, and Wildwood Drive (Table 8, Map 2). Three opportunities were identified along Logwood Circle, where video inspection of the stormline network identified five lines in need of replacement. In this instance, the stormlines could be replaced with perforated HDPE in stone bedding to effectively function as infiltration trenches, and if feasible or desired, the associated catchbasins could be replaced with drywells. Collectively, these green stormwater infrastructure retrofits would manage at least 26 impervious acres and result in a P load reduction of 29.8 kg P/yr.

4. Municipal Hydrologically Connected Road Segments

The Municipal Roads Requirements outlined in Section 8.3 of the MS4 Permit¹ reflect those of the Municipal Roads General Permit⁶ (MRGP), which require municipalities to implement a long-term plan to improve hydrologically connected road drainage systems to a set of standards included in the Permit. MS4s were required to conduct a Road Erosion Inventory (REI) and Implementation Table for all municipal hydrologically connected road segments by April 1, 2020. The REI was used to determine if road segments met the standards of Section 8.3.C of the MS4 Permit, while the Implementation Table is used to prioritize improvement of road segments that need to be brought up to standards. The results of the Essex Village/Town REI can be found on the MRGP Implementation Table Portal,⁷ and the results summarized in this section were obtained from the Chittenden County Regional Planning Commission in October 2020.

The improvements required to bring a road segment up to standards vary based on road category but can involve BMPs such as stabilizing ditches with vegetation/stone, installing turn outs and/or stabilizing erosion at culvert outlets. The ANR has defined P crediting methodologies in a draft Tracking and Accounting SOP⁸, which are based on pre- and post-construction road conditions as well as road typology (paved and unpaved roads with ditches, paved roads with catch basin outlets, and Class 4 roads). While standards and crediting for paved and unpaved roads with ditches and Class 4 roads are applied at the road segment level, the standards and crediting for paved roads with catch basins are derived from the volume of erosion stabilized at drainage system outlets(Appendix C).

Both Essex Junction's and Essex Town's MS4s have been proactively completing improvements to bring road segments up to standards and stabilize erosion at outlets since the latest MS4 Permit became effective in 2018. As required by the MS4 Permit, the remaining road segments that Do Not Meet or Partially Meet standards must be brought up to standards, with the highest-priority improvements to be completed within the current permit term. Hydrologically connected municipal road segment and outlet improvements completed through December 2020 or anticipated in the Essex Junction MS4 (Figure 2) account for up to 27% (2.6 kg/yr) of annual P load reduction in the Malletts Bay Lake segment where the P reduction target is already met, but only a small proportion of the P load reduction needed in the Village's Main Lake segment. In contrast, completed and remaining road segment repairs and outlet stabilization measures in the Essex Town MS4 may account for 42% (16.6 kg/yr) of the target P reduction in the Malletts Bay lake segment, and 11% (4.6 kg/yr) in the Main Lake segment. The P credit gained from completed roadway improvements, and anticipated P reductions from planned improvements as identified in the REI and Implementation Tables, are summarized below for both MS4s.

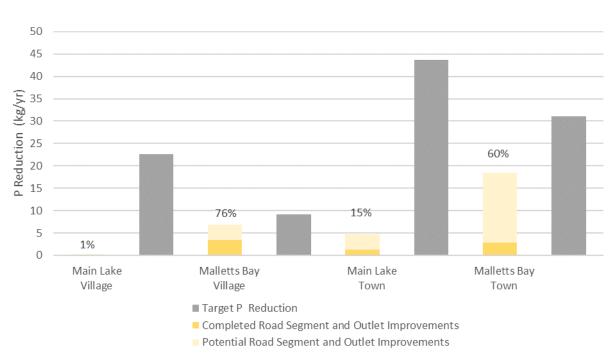

Figure 2. Essex Junction and Essex Town, total P reduction from existing and remaining outlet and road segment improvements as compared to required total P reduction (kg/yr). See Table 15 for Essex Junction summary and Table 22 for Essex Town summary.

Cost Estimation for Improvements to Bring Hydrologically Connected Road Segments and Outlets Up to Standards

For road segments and closed drainage outlets where improvements are required to come into compliance with MRGP standards, implementation costs were estimated using construction costs from recent projects completed by both MS4s, recent projects completed by consulting team members, and unit costs per road segment and outlet drawn from a review of Municipal Roads Grants-in-Aid data completed for the project *Cost Effectiveness and Operation & Maintenance Standards of Clean Water Projects in Vermont*, where final outputs were submitted to Vermont DEC in March 2021.

For paved roads with ditches, gravel roads, and Class 4 roads, planning level estimates of the estimated cost to bring each road segment up to standards were calculated on a per-road-segment basis using median cost to bring road segments partially or fully up to standards (Table 9). For paved roads with catch basins to outlets, improvement costs were estimated on a per-outlet basis using the median cost of outlet improvement projects completed by the Village and Town to date, after including a 25% contingency (Table 10). Outlets that were determined to be partially meeting standards were estimated at 50% of the median outlet repair cost. Additional unit cost estimation resources for common crown, shoulder, ditch, and culvert improvements are presented in Table 11.

For both road segment and outlet improvements, costs presented in this PCP should be considered orderof-magnitude estimates. The Essex Town MS4 will complete a 10-year Gravel Road Stormwater Management Plan in 2021-2022, which will become part of this PCP upon completion and adoption by the Town. Furthermore, the repairs needed to bring closed drainage and culvert outlets up to standards are extremely variable, depending upon the unique conditions of each closed drainage system and outlet.

Municipal Roads Grants-in-Aid Summary Statistic	Partially Meets	Does Not Meet
Class 3 Mean Improvement Cost per 100 m	\$4,200	\$5,600
Class 3 Median Improvement Cost per 100 m	\$3,800	\$4,300
Class 3 Mean Improvement Cost per mile	\$67,600	\$88,800
Class 3 Median Improvement Cost per mile	\$61,000	\$67,700

4.1. Essex Junction Completed and Planned Improvements to Bring Hydrologically Connected Road Segments up to Standards

Of the 39 km (386 road segments) of hydrologically connected roadway in Essex Junction, approximately 10.9 km (109 segments) were initially identified as Not Meeting Standards in the 2017 REI. Most of these road segments are paved roads with catch basins associated with 12 culvert outlets (Table 12, Table 13, and Map 2).

Since completing the 2017 REI, the Essex Junction MS4 has proactively implemented roadway improvements⁹ including the stabilization of six eroding outlets along paved roadway with curbs (Table 12). Most of these improvements are tracked correctly in the MRGP datasets, but in the case of improvements completed on Fairview Drive in 2019, outlets EJCT038 and EJCT039 were found to be reversed in the inventory. EJCT038 had no erosion, while EJCT039 had gully erosion and did not meet standards. EJCT039 was repaired in 2019 as part of the Fairview Gravel wetland project. Additionally, Outlet 1094 off Corduroy Road was stabilized in October 2020 (Better Roads grant 0670). This outlet does not appear in the REI outlets dataset, but the field work conducted in completing this repair verified its hydrologic connectivity. The repair stabilized 49 cubic yards of erosion, resulting in an estimated P load reduction of 0.76 kg/yr that is included in Table 12 and Table 15. *This outlet, which is related to road segments 7030_CORDUROY_RD_13208.1 and 7030_MASON_DR_38565.1, should be added to the MRGP inventory of hydrologically connected outlets.*

The completed outlet repairs resulted in an estimated 220 cubic yards of erosion managed and 3.4 kg/yr of P reduction, all within the Malletts Bay Lake segment (Table 12). Bringing the remaining culvert outlets and thus the associated road segments up to standards, as required by the MS4 Permit, will result in an additional 3.8 kg/yr reduction in P and 246 cubic yards of erosion stabilization at outlets on paved roads with and without curbs (Table 13), at an estimated implementation cost of \$53,900 (Table 14). The total estimated P reduction for existing and planned roadway improvements in Essex Junction is 0.3 kg/yr (1%) and 6.9 kg/yr (76%) for the Main Lake and Mallets Bay Lake Segments, respectively (Table 15).

Total	3.4	3.8	7.2	31.7	22.4%

4.2. Essex Town Completed and Planned Improvements to Bring Hydrologically Connected Road Segments up to Standards

Of the 57.9 km of hydrologically connected roadway in the Essex Town MS4, 9.8 km were required to be brought up to standards in the initial 2017 REI. In Essex Town, a smaller proportion of these road segments (23 in total) are paved roads with catch basins associated with 12 culvert outlets (Table 17 and Appendix C).

Since completing the 2017 REI, the Essex Town MS4 has prioritized bringing Class 4 and gravel road segments up to standards¹⁰, rather than focusing on outlet rehabilitation. Outlet 2OLET065 off Bobolink Circle was stabilized in 2019, resulting in an estimated P load reduction of 1.33 kg/yr (Table 16). Completing repairs at the remaining identified culvert outlets, and thus bringing the associated road segments up to standards as required by the MS4 Permit, will result in an estimated 178 cubic yards of erosion stabilization

¹⁰https://anrweb.vt.gov/DEC/IWIS/MRGPReportViewer.aspx?ViewParms=True&Report=Inventory&MunicipalityID=69#Pb451ab527ee947e89f437b4 a19576123_2_40iT0

and an estimated 1.71 kg/yr P load reduction at outlets on paved roads with curbs (Table 17), at an estimated implementation cost of \$93,100 (Table 18).

Table 18. Estimated Implementation Costs for Catch Basin Outlet Stabilization, Essex Town

Since completing the 2017 REI, the Town has implemented improvements to bring one Class 4 road up to standards (ID 7030_W_Sleepy_Hollow_Rd_5), for a P load reduction of 0.25 kg/yr (Table 19). The erosion volume corrected for this road segment was estimated at approximately 6 CY, so a 40% P reduction was applied consistent with the draft MRGP Tracking and Accounting SOP. However, the erosion was repaired using MRGP practices, including a new stone-lined ditch on the one side of the road, re-establishment and stone-lining of the existing ditch, creation of two separate stone turnouts, and replacement of an existing 15" driveway culvert with a new 18" culvert. While the Town is not legally obligated to maintain Class 4 roads, the Essex Town MS4 realizes that only stabilizing gully erosion on Class 4 roads is often not sufficient when erosion is tied to the road's drainage. In order to properly mitigate the erosion, a suite of appropriate MRGP BMPs were required and were implemented. Further discussion of the appropriateness of P crediting with the Stormwater Program may be warranted, particularly if other MS4 and MRGP permittees are encountering similar issues with erosion mitigation on Class 4 roads.

Since the 2017 REI was completed, Essex Town has also brought 14 gravel road segments (on Brigham Hill and Osgood Hill Roads) up to standards¹¹, yielding a P reduction of 2.7 kg/yr (Table 19).

¹¹

 $https://anrweb.vt.gov/DEC/IWIS/MRGPReportViewer.aspx?ViewParms=True\&Report=Inventory\&MunicipalityID=69\#Pb451ab527ee947e89f437b4a19576123_2_40iT0$

Total	1	14	0	15	0.25	2.67	0.00	2.92	

Table 19. Essex Town summary of completed road segment improvements by road type

Bringing the remaining gravel and paved, uncurbed road segments up to standards may result in an additional 17.3 kg/yr P load reduction from 62 road segments, primarily located in the Malletts Bay Lake segment (Table 20). Implementation costs for these improvements are estimated to be approximately \$245,100 (Table 21).

The total estimated P reduction for existing and planned roadway improvements in the Town is 2.1 kg/yr (5%) for the Main Lake segment and 18.1 kg/yr (58%) for the Malletts Bay Lake segments, respectively (Table 22).

In 2021, Essex Town will complete road segment improvements at Catella Road, Hanley Lane, and Osgood Hill Road. The MS4 will also begin the preparation of a 10-year MRGP Improvement Plan, which is anticipated to be completed in 2022 and which will provide refined prioritization and customized unit-cost-based estimates for completing the remaining road segment improvements.

5. Non-Structural Controls

The Village and Town share equipment to conduct a non-structural program that includes street sweeping and catch basin cleaning for a total of 134 ac of impervious roadway in the Town and 112 ac in the Village. A 2013 vacuum sweeper sweeps streets twice per year during the fall months, and main travel routes in the Village are swept three to four times per year. A vactor is shared, and catch basins are cleaned once every four years in the Town and once every two years in the Village.

To determine the benefit of current and potential adjustment to future non-structural controls, Essex Village/Town participated in a regional study with the United States Geological Services (USGS) in cooperation with CCRPC, DEC, and several additional partners¹². Draft results of the study were provided by DEC in June 2020, and detail on the street sweeping credit calculations in the study were provided by DEC staff in October-November 2020. Stone conducted additional quality control checks and expanded the calculations for current practices to include all sweeping activities regardless of tree cover. The annual P load reductions achieved by current non-structural controls, and those possible through enhanced street sweeping measures, are summarized in Figure 3 and further described below.

Additional Non-Structural P Reduction Total P Reduction Target

Figure 3. Essex Junction and Essex Town, annual P reduction from current, recommended, and potential additional non-structural controls (kg/yr). Table 33 contains a summary. See Tables 23, 24, and 27 for Essex Junction, and Tables 28, 29, and 32 for Essex Town.

 $^{^{12}} https://www.usgs.gov/centers/new-england-water/science/nutrient-and-sediment-load-reduction-estimates-intensive-street?qt-science_center_objects=0#qt-science_center_objects$

5.1. Essex Junction Non-Structural Controls

The Village achieves a 0.7 kg/yr reduction from current street sweeping and catch basin cleaning practices (Table 23). If the MS4 were to adopt the Wisconsin Department of Natural Resources' methodology of leaf management (sweeping streets with >17% tree cover four times in the fall with any sweeper technology), and VTDEC continues to accept this currently-draft crediting method, the Village could achieve an additional 12.8 kg/yr P reduction (Table 24, Figure 3).

Lake Segment	Catch Basin Cleaning P Reduction (kg/yr)	Sweeping P Reduction (kg/yr)	Total P Reduction (kg/yr)	Target P Load Reduction (kg/yr)	% of Total P Reduction
Main Lake	0.30	0.15	0.46	22.60	2.0%
Malletts Bay	0.15	0.07	0.22	9.10	2.4%
Total	0.45	0.23	0.68	31.70	2.1%

Table 23. Essex Junction total P reductions from current non-structural practices

Note: Current non-structural controls in Village of Essex Junction include sweeping routes 2 times per year (spring and fall), vacuum assisted. 2% maximum reduction credit, discounted 90% to account for 2000 start of present sweeping regime. Catch basin cleaning occurs once every two years, as inspections warrant.

Table 24. Essex Junction	potential additional P reductions from WI-based non-structural pract	ices
--------------------------	--	------

Lake Segment	Additional Sweeping P Reduction (kg/yr)	Target P Load Reduction (kg/yr)	% of Total P Reduction
Main Lake	11.28	22.60	49.9%
Malletts Bay	1.48	9.10	16.2%
Total	12.76	31.70	40.2%

Note: Assumes sweeping routes with >17% tree cover 4 times in the fall, any technology. 17% P reduction efficiency. P reduction for current activities is subtracted. Only the Green and Blue sweeping routes are eligible. No change is forecast for catch basin cleaning, assumed it occurs once every two years as inspections warrant.

Sweeping data for 2020 activity were further assessed by sweeping route to provide guidance for future enhancements if desired by Essex Junction. Of the five routes assessed in the Clean Streets study, the Blue route, located in the Main Lake segment, was the largest route with tree cover <17% assessed in terms of road miles (Appendix D and Table 25). The Blue route was the route swept most frequently in 2020, accruing the greatest P credit (Table 26). Future enhancements to sweeping frequency should be targeted to the Blue route, where a P reduction of 8.6 kg/yr may be achieved through enhanced fall sweeping (Table 27).

Table 25. Essex Junction, Road Miles and Paved Road A	rea by Lake Segment and Sweeping Route
Table 25. Essex suffection, noda miles and ravea noda A	ica by lake beginerit and bireeping house

		1 5 41		,	5

Dark green	0.10	
Light Green		0.14
Pink	0.31	
Red		0.50
Total	1.37	0.64

Table 26. Essex Junction, Summary of P Reduction Credit for Sweeping by Route, 2020 data

Table 27.Essex Junction, Summary of Estimated P Reduction Possible Through Application of Wisconsin
Sweeping Methodology

Route	Main Lake (kg/yr)	Malletts Bay (kg/yr)
Blue	8.55	
Dark green	0.93	
Light Green		1.24
Total	9.48	1.24

Note: Estimated P reduction approximated assuming two lane widths of 8.5 ft. swept per street to convert road miles to acres. This results in a slightly lower estimated P load, and thus P credit, compared to the high-level summary values provided in Table 24.

5.2. Essex Town Phosphorus Reduction Benefits of Non-structural Controls

The Town achieves a 1.4 kg/yr P reduction from current street sweeping and catch basin cleaning practices (Table 28). If the MS4s were to adopt the Wisconsin Department of Natural Resources' methodology of leaf management (sweeping streets with >17% tree cover four times in the fall with any sweeper technology), and VTDEC continues to accept this currently-draft crediting method, the Town could achieve an additional 19.7 kg/yr P reduction (Table 29, Figure 3).

Lake Segment	Catch Basin Cleaning P Reduction (kg/yr)	Sweeping P Reduction (kg/yr)	Total P Reduction (kg/yr)	Target P Load Reduction (kg/yr)	% of Total P Reduction
Main Lake	0.20	0.85	1.05	43.60	2.4%
Malletts Bay	0.07	0.28	0.35	31.00	1.1%
Total	0.27	1.13	1.40	74.60	1.9%

Table 28. Essex Town total P reductions from current non-structural practices

Note: Current non-structural controls in Essex Town include sweeping routes 2 times per year (spring and fall), vacuum assisted, with a 2% maximum reduction credit, discounted 60% to account for 2004 start of present sweeping regime. Catch basin cleaning occurs once every two years, as inspections warrant.

Lake Segment	Additional Sweeping P Reduction (kg/yr)	Target P Load Reduction (kg/yr)	% of Total P Reduction
Main Lake	16.50	43.60	37.8%
Malletts Bay	3.23	31.00	10.4%
Total	19.73	74.60	26.4%

Table 29. Essex Town potential additional P reductions from WI-based non-structural practices

**Assumes sweeping routes with >17% tree cover 4 times in the fall, any technology. 17% P reduction efficiency. P reduction for current activities is subtracted. Sweeping routes EX4, EX5, EX10, EX13, and EX23 are not eligible, as tree cover is less than 17%. No change is forecast for catch basin cleaning, assumed it occurs once every two years as inspections warrant.

Sweeping data for 2020 activity were further assessed by sweeping route to provide guidance for future enhancements if desired by Essex Town. Of the 13 routes assessed in the Clean Streets study, Town Routes 1, 3, 5, and 11, located in the Main Lake segment, were the most promising routes with tree cover <17% assessed in terms of road miles, and each with potential P credit of 2.0 kg/yr or more if the Wisconsin-style sweeping method is applied (Appendix D and Table 30). Due to pandemic related staffing challenges, the Town was not able to complete as much sweeping as anticipated, and the routes utilized in the Clean Streets study were not generally followed in 2020. Even given those challenges, the four routes discussed above tended to be swept in a way that accrued more P credit compared to other routes (Table 31). Future enhancements to sweeping frequency should be targeted to Routes 1, 3, 5, and 11 (Table 32).

	Roa	Road Miles		Area (acres)
Town Route	Main Lake	Malletts Bay	Main Lake	Malletts Bay

Malletts Bay	0.07	0.37	0.44
Total	0.27	3.68	3.95

Table 33. P load reductions from recommended enhanced sweeping on selected routes (kg/yr)

The MS4 permit does allow sharing of implementation costs between permitted MS4s, and Section 6.3 of the permit explains the requirements for sharing implementation. During PCP development, the concept of sharing the phosphorus reduction credit accrued from potential sweeping enhancements was explored. In an example case between Essex and Essex Junction, Essex can enter into a written agreement with Essex Junction to perform enhanced street sweeping to achieve Essex Junction's total P reduction. This agreement would be included in the PCPs of both MS4s and could be reported on annually by Essex. In Essex Junction's PCP, Vermont DEC would require alternative options to achieve the P reductions in case the enhanced street sweeping or sharing agreement does not materialize. The alternative options would be planned for later years in the PCP, similar to the future growth component for FRPs. While at this time it does not appear that credit sharing will be necessary for either MS4 to meet P reduction targets, it remains an option for future consideration if and as needed.

6. Municipal Ordinances or Regulations and Future Growth

Building on a previous code review completed in 2019 by the Vermont League of Cities and Towns (VLCT), a targeted review of local ordinances and regulations was completed to evaluate:

- Compliance with Vermont MS4 General Permit requirements,
- Consistency with State stormwater management standards,
- Effectiveness in promoting green infrastructure and environmentally sensitive site design, and
- Opportunities to earn phosphorus-reduction credit.

The following Village and Town documents were reviewed:

- Town and Village Stormwater Management Ordinance (Essex Town Ordinance 10.20 and Village Code Section 1901)
- Village of Essex Junction Land Development Code
- Town of Essex Public Works Standard Specifications for Construction
- Town of Essex Subdivision Regulations
- Town of Essex Zoning Regulations

Appendix E includes the detailed results of the ordinance review and recommendations for future adjustments. Both Essex Junction and the Town of Essex anticipate beginning extensive reviews of and updates to their local land development regulations in 2021, representing a timely opportunity for the recommendations contained in Appendix E to be considered and ultimately implemented.

Appendix E also contains recommendations regarding enhancements to reporting on the inspection and maintenance of sub-jurisdictional stormwater BMPs, should the MS4s choose to include these practices as creditable in meeting MS4-required P load reductions in the PCPs in the future. In addition, if the Village or Town choose to reduce the applicability threshold for local stormwater permitting below 0.5 acres of impervious surface, the reviewers recommended establishing an offsite mitigation program or a fee-in-lieu program allowing small projects the option to pay a fee instead of constructing on-site practices. Add offsets as an option, not strictly fee based. The Village and Town may also consider adding a requirement for a property to demonstrate they have maximized treatment of stormwater on site before applicants can offset or pay fees, similar to the Engineering Feasibility Assessment (EFA) process under the Vermont DEC General Permit 3-9050.

A one-time fee may also be charged to developers turning over streets and associated drainage infrastructure to the Village or Town for management. Enabling language exists in both municipalities' ordinances to allow both of these recommendations to move forward, and refinements completed during the upcoming broader review process may enable both the Village and Town stormwater programs to generate revenue to put towards retrofits of municipally owned properties.

7. Progress Summary and Plan for Meeting Phosphorus Targets

Summarizing the P reduction benefits of structural STPs, and the benefits of present and required future MRGP improvements to road segments and outlets, demonstrates that the Essex Junction and Essex Town MS4s have both made substantial progress towards meeting the P reduction targets required under the Lake Champlain P TMDL and each MS4's general permit (Figure 4). In the Malletts Bay Lake segment, constructed and design-phase structural STPs, and other measures committed to through various regulatory requirements, exceed P reduction targets without increasing the frequency or extent of non-structural measures in both Essex Junction and Essex Town (Figure 4). Non-structural controls, and particularly enhanced street sweeping measures, represent a small proportion of the P reductions that are possible to be gained in this Lake segment, and are not necessary in order to meet target P reductions for either MS4 in the Malletts Bay drainages.

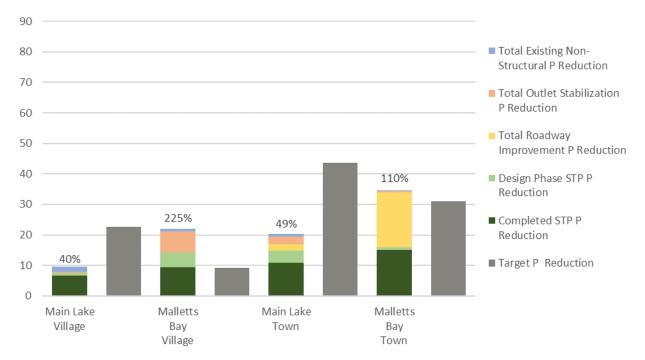

Figure 4. P load reductions (kg/yr) credited to existing and design-phase structural STPs, existing and required road segment and outlet improvements, and existing non-structural BMPs and controls, Essex Junction and Essex Town

In the Main Lake segment, constructed and design-phase BMPs, including stormwater retrofits, road segment improvements, and outfall stabilization, as well as structural measures that will be required under FRPs and the MRGP, do not meet or exceed P reduction targets without implementing additional structural STPs or increasing the frequency or extent of non-structural measures in both Essex Junction and Essex Town. The planned structural STPs identified in Sections 3.2 and 3.4, coupled with the limited enhancements to street sweeping identified in Section 5, represent one path that both MS4s may take to achieve remaining required P reductions (Figure 5 and Table 34).

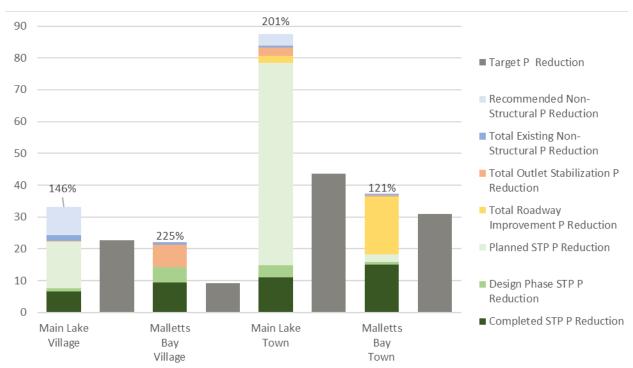

Figure 5. P load reductions (kg/yr) credited to existing, design-phase, and projected structural STPs, existing and required road segment and outlet improvements, and existing and recommended non-structural controls, Essex Junction and Essex Town

	<i>J, J</i>	,	,		,	
Lake Segment	Existing BMPs (kg/yr)	Design-Phase STPs and Remaining MRGP (kg/yr)	Projected BMP P Reduction (kg/yr)	Total BMP P Reduction (kg/yr)	Target P Reduction (kg/yr)	% of Total P Reduction
Village of Esse	x Junction Su	mmary				
Main Lake	8.4	1.2	23.5	33.1	22.6	146%
Malletts Bay	13.5	8.5	0.0	22.1	9.1	225%
Total	21.9	9.7	23.5	55.1	31.7	
Town of Essex	Summary					
Main Lake	13.1	7.2	67.2	87.5	43.6	201%
Malletts Bay	18.2	16.5	2.8	37.5	31.0	121%
Total	31.3	23.7	70.0	125.0	74.6	

Table 34. Existing, Design-Phase, and Projected BMP P Reduction Summary

Enhanced street sweeping measures may provide substantial reasonable assurance for the remaining P reductions necessary to meet target P reductions in the Main Lake segment, provided that VTDEC retains the Wisconsin-style crediting or a similar system for enhanced fall-focused street sweeping measures (Section 5 and Figure 5). However, enhanced sweeping regimes are not anticipated to be necessary in order for either Essex Junction or Essex Town to meet MS4 target P reductions.

8. Implementation Schedule

A draft implementation schedule for the Essex Junction MS4 and Essex Town MS4 PCPs is presented on the following page. This schedule will be adjusted following consultation with Vermont DEC and on an annual basis as required by Part 8.2.D of the 2018 MS4 General Permit.

This PCP represents a broad overview and remains a working document, subject to change as projects are further investigated. Projected projects, particularly structural stormwater treatment practices, require further evaluation to determine their feasibility and to refine the high-level cost estimates provided in this document. The next step is to refine the prioritization provided in the draft implementation schedule. Feasibility evaluation will be necessary, and for a few projects included in this PCP it is already underway. Projected retrofit projects with the highest cost-effectiveness and few barriers to implementation, or which are already in scoping or design phases, are likely to be advanced first. These structural stormwater retrofits include but are not limited to:

Essex Junction:

• Tyler Drive, Wilkinson Drive, and South Street

Essex Town:

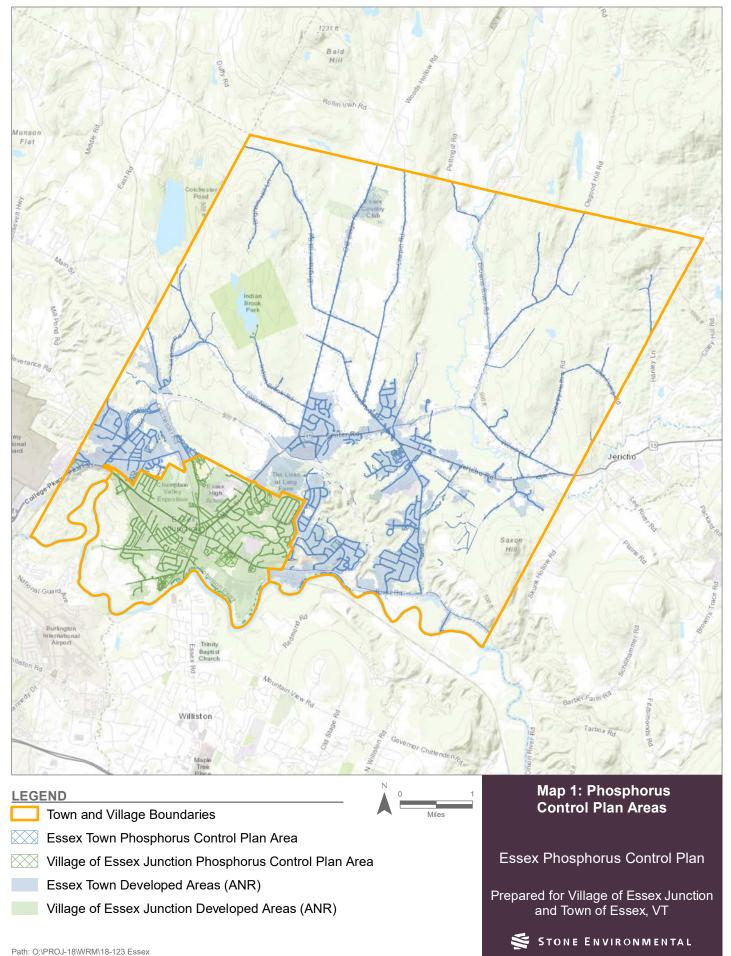

- Outfall 126
- Tanglewood Drive and Fern Hollow Road
- Logwood Circle

In addition, Essex Town is beginning the preparation of a 10-year MRGP Improvement Plan, which is anticipated to be completed in 2022 and which will provide refined prioritization and customized unit-cost-based estimates for completing the remaining road segment improvements. Upon completion, the MRGP Improvement Plan will become part of this PCP pending adoption by the Town Selectboard.

Appendix D - Street Sweeping Route Maps and Details

STONE ENVIRONMENTAL

Sweeper Routes < 17% forested

Winooski River (Main Lake), Red Malletts Bay - DD (Malletts Bay), Red

Essex Junction

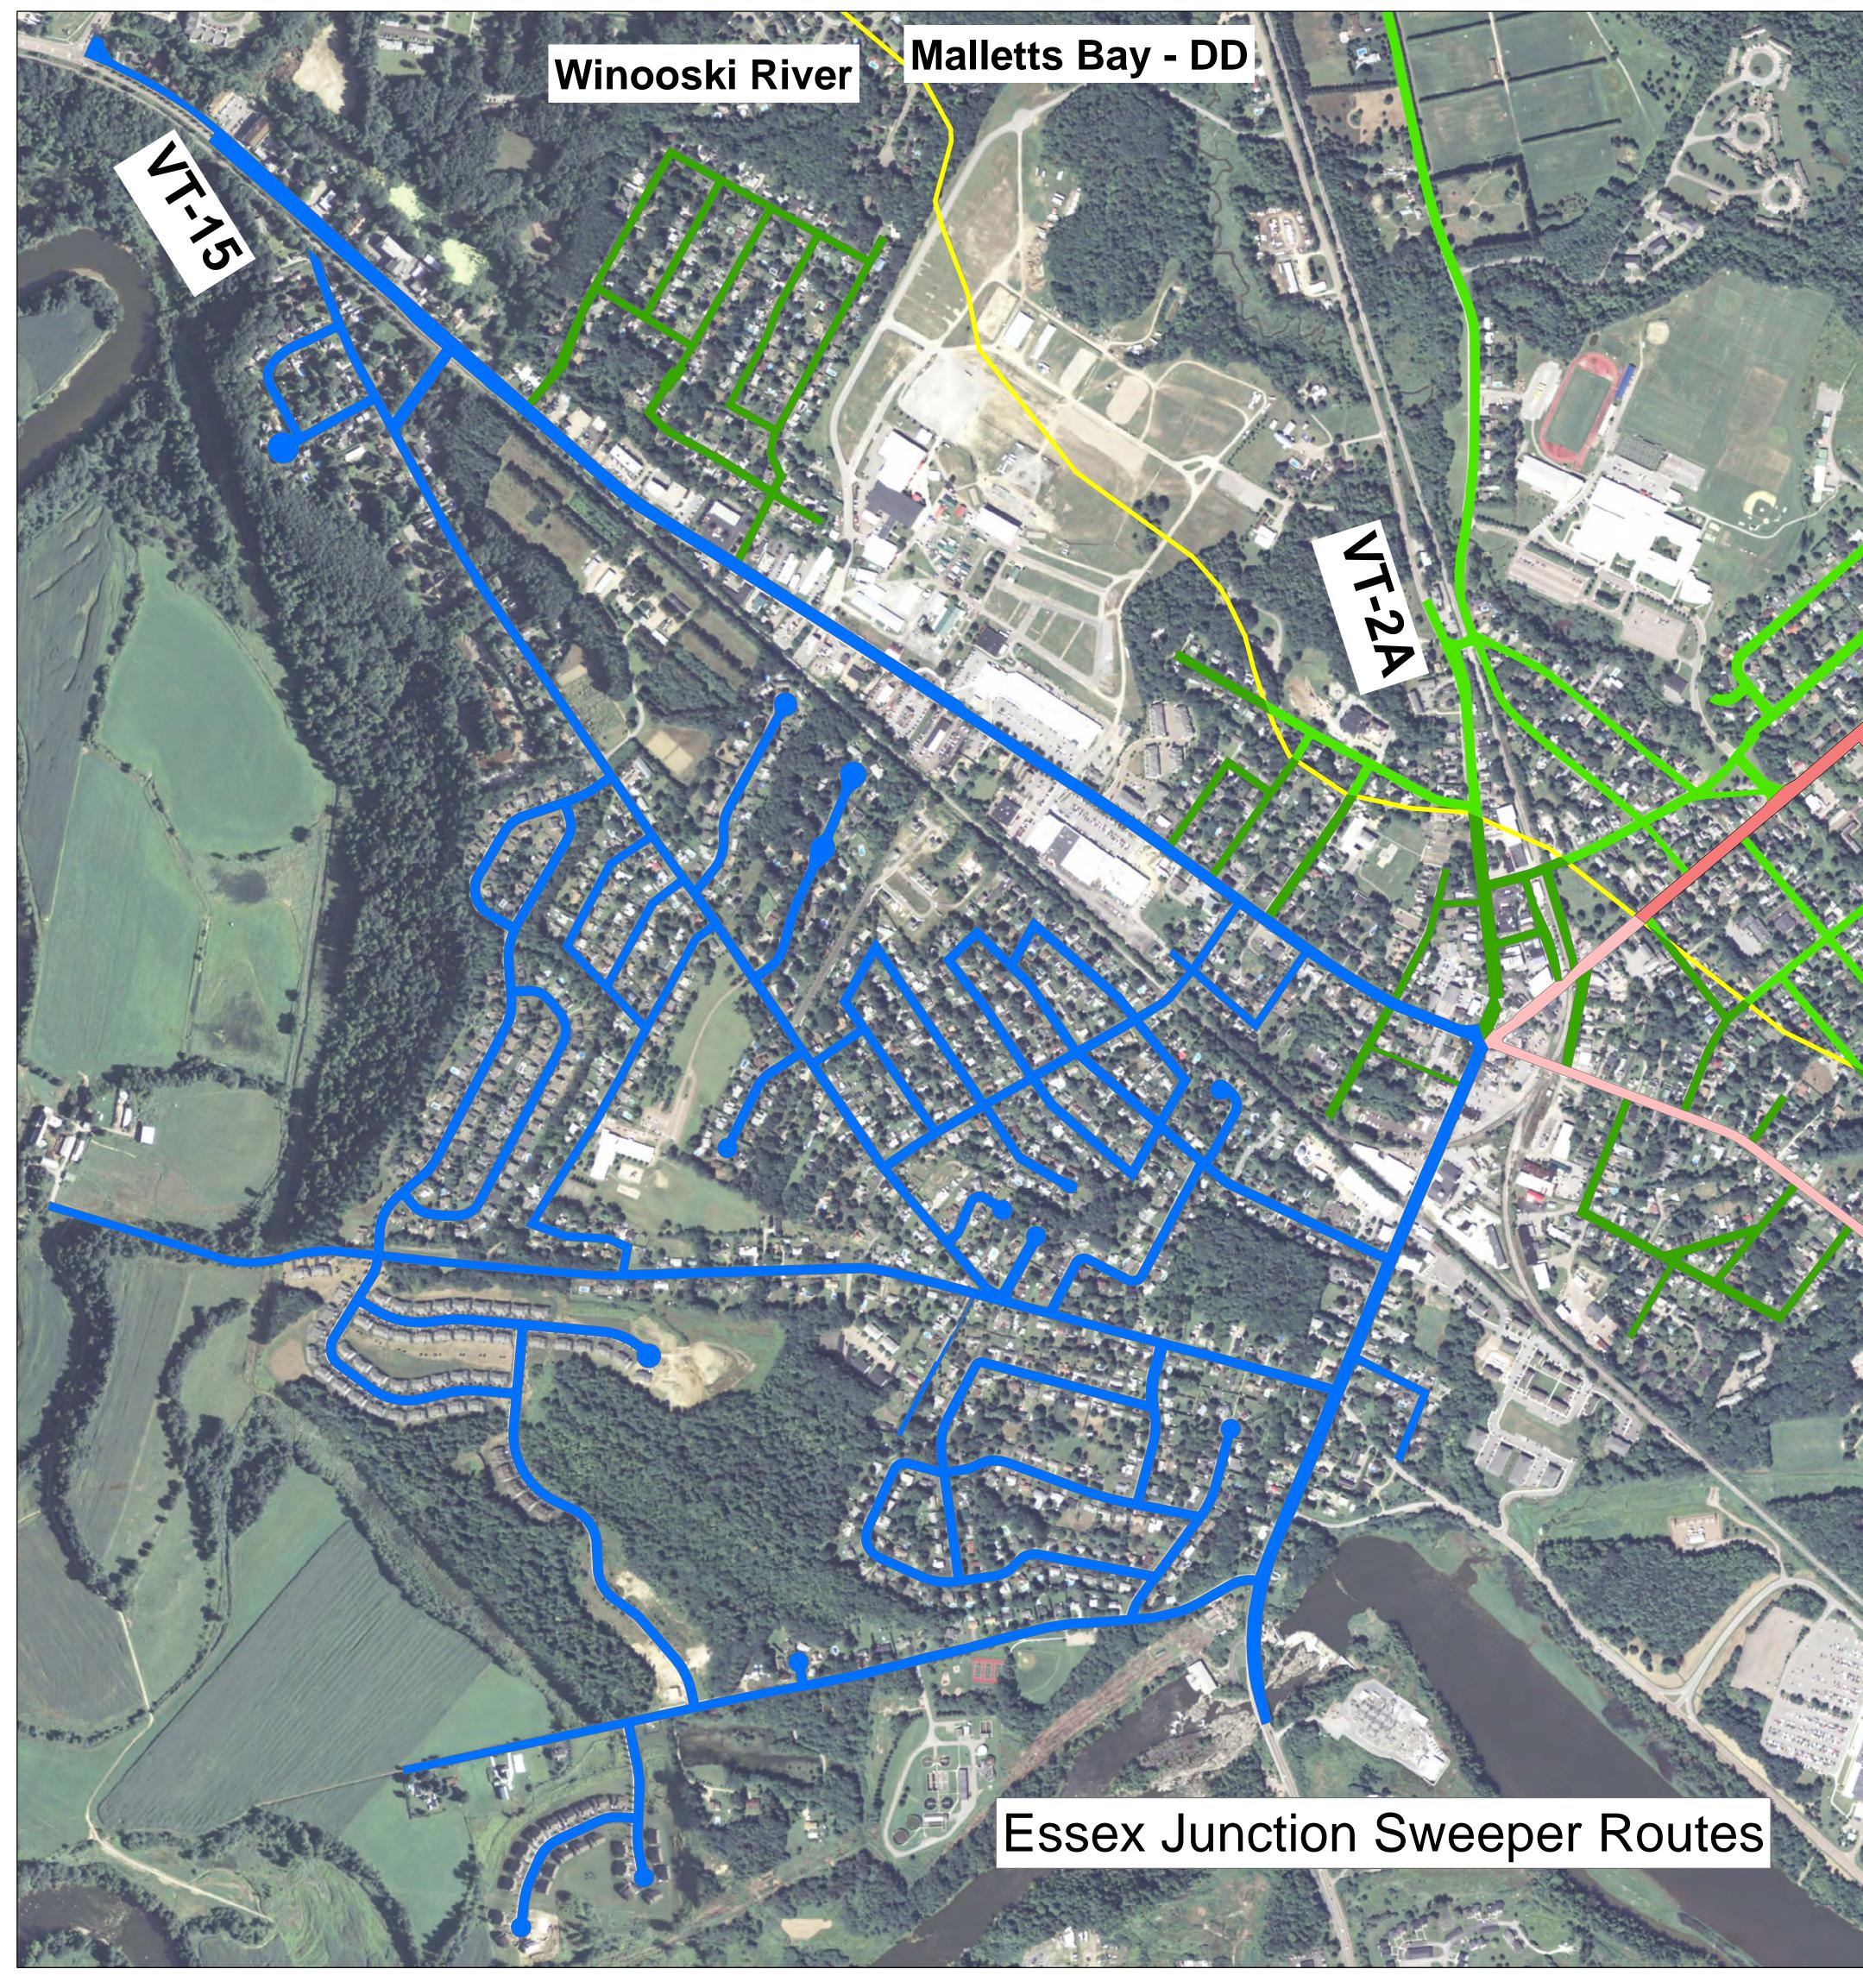

The Village of Essex Junction currently manages its municipal streets in the following way:

- The Village has about 112 acres of impervious roadway surface that it manages both for catchbasin cleaning, street sweeping and leaf and litter control. Most of the Village streets are curbed or bermed on the roadway edge. The Village owns a 2013 vacuum sweeper and sweeps the streets 2x/year during the sweeping season. Main travel routes are swept 3-4x/yr. The Village also has a vactor and cleans catchbasins on average about 1 basin/2years. The Village does not have a municipal leaf collection program. Catchbasin cleanings, leaves and street sweeper materials are stockpiled separately at the WWTP at 69 Cascade St. The Village has <u>not adopted</u> an ordinance that prohibits residents from placement of leaves in the street
- 2. If the Village were to implement a higher frequency of street sweeping during October-November on the <u>blue and green sweeping routes and adopt the Wisconsin DNR method of leaf management it could achieve a 12.9 kg/yr. net phosphorus reduction from Essex Junction Village Streets to the Winooski River and Malletts Bay. This would require an increase from 2-3 sweepings per year on these routes to 6-8 sweepings per year. The sweeping frequency would need to be adjusted to 2x/October and 2x/November. The Village's current sweeping practices have been in effect since about 2008 and therefore the credit has been prorated to the time frame of the TMDL monitoring period (2000-2009). The current sweeping practice removes about .65 kg/yr. of phosphorus from Essex Junction Streets to the Winooski River and Malletts Bay. Similarly, the Village's catchbasin cleaning practice has been in place since 2008. Therefore, the total creditable practices are 1.12 kg/yr.</u>
- 3. There is a Lake Champlain TMDL phosphorus control plan requirement for the Village of Essex Junction and <u>the current practices achieve about 5% (1.12 kg/yr.) of the target (23.08 kg/yr.)</u>. The target includes 2 different SWAT drainages as shown.
- 4. The attached table lists ineligible routes first (<17 percent tree cover) and then eligible routes by SWAT model drainage area ranked from highest to lowest in percentage of tree cover. The ranking places the highest phosphorus loading routes first based on the fact that there is a linear relationship between leaf area cover and dissolved phosphorus loading (Janke, 2018).
- 5. The Village of Essex Junction implemented their current catchbasin cleaning practice after 2008, and as stated above, it is therefore a creditable practice. If the Village were to adopt the most effective practice for catchbasin cleaning (2x/yr.) it could achieve a credit of 2.27 kg/yr.
